Crystal engineering: the design of organic solids by G. R

crystal engineering is to construct crystal structures from molecular structures. This is the synthetic step, and it is not straightforward because of the emergent nature of the crystal structure. To develop a synthetic strategy, a retrosynthetic step is invoked which effectively simplifies the crystal structure to a smaller unit called the synthon.

Crystal engineering, the design of molecular solids, is the synthesis of functional solid-state structures from neutral or ionic building blocks, using intermolecular interactions in the design strategy.

Crystal Engineering: A Holistic View - Desiraju - 2007

What are the relationships between crystal structures and properties for molecular crystals? These are some of the questions that are being addressed today by the crystal engineering community, a group that draws from the larger communities of organic, inorganic, and physical chemists, crystallographers, and solid state scientists.

Crystal engineering: A brief overview - CORE

In an industrial crystallization process, crystal shape strongly influences end-product quality and functionality, as well as downstream processing. In addition, nucleation events, solvent effects, and polymorph selection play critical roles in both the design and operation of a crystallization plant and the patentability of the product and process.
