

nonlinear signal processing a pdf

Digital signal processing is the processing of digitized discrete-time sampled signals. Processing is done by general-purpose computers or by digital circuits such as ASICs, field-programmable gate arrays or specialized digital signal processors (DSP chips).

Signal processing - Wikipedia

The most common processing approach in the time or space domain is enhancement of the input signal through a method called filtering. Digital filtering generally consists of some linear transformation of a number of surrounding samples around the current sample of the input or output signal.

Using our design example, the peak allowable power is specified as 220 VRMS, and since we are ultimately

clipping the signal to a square wave, this is equivalent to $220 V_{peak}$.
