The metal-oxide-semiconductor field-effect transistor (MOSFET, MOS-FET, or MOS FET) is a type of field-effect transistor (FET), most commonly fabricated by the controlled oxidation of silicon. It has an insulated gate, whose voltage determines the conductivity of the device. This ability to change conductivity with the amount of applied voltage can be used for amplifying or switching electronic ...

Se denomina unión PN a la estructura fundamental de los componentes electrónicos comúnmente denominados semiconductores, principalmente diodos y transistores. Está formada por la unión metálica de dos cristales, generalmente de silicio (Si), aunque también se fabrican de germanio (Ge), de naturalezas P y N según su composición a nivel atómico.

1. INTRODUCTION - A transistor is a small electronic device that can cause changes in a large electrical output signal by small changes in a small input signal. That is, a weak input signal can be amplified (made stronger) by a transistor. For example, very weak radio signals in the air can be picked up by a wire antenna and processed by transistor amplifiers until they are strong enough to be ...

In semiconductor production, doping is the intentional introduction of impurities into an intrinsic semiconductor for the purpose of modulating its electrical and optical and structural properties. The doped material is referred to as an extrinsic semiconductor. A semiconductor doped to such high levels that it acts more like a conductor than a semiconductor is referred to as a degenerate ...

2 Si photodiodes Photodiodes are photosensors that generate a current or voltage when the PN junction in the semiconductor is irradiated by light.

Aunque el diodo semiconductor de estado sólido se popularizó antes del diodo termiónico, ambos se

desarrollaron al mismo tiempo. En 1873 Frederick Guthrie descubrió<sup>3</sup> el principio de operación de los diodos túnel. Guthrie descubrió<sup>3</sup> que un electroscopio cargado positivamente podía descargarse al acercarse una pieza de metal caliente, sin necesidad de que éste lo tocara.

Junction FETs JFET is a high-input resistance device, while the BJT is comparatively low. If the channel is doped with a donor impurity, n-type material is formed and the channel current will consist of electrons. If the channel is doped with an acceptor impurity, p-type material will be formed and the channel current will
