The Big Data of Ice, Rocks, Soils, and Sediments

The physical properties of soils, in order of decreasing importance for ecosystem services such as crop production, are texture, structure, bulk density, porosity, consistency, temperature, colour and resistivity. Soil texture is determined by the relative proportion of the three kinds of soil mineral particles, called soil separates: sand, silt, and clay.

Kaolinite ($\text{Al}_2\text{Si}_2\text{O}_5\text{H}_4$) is a clay mineral, part of the group of industrial minerals, with the chemical composition $\text{Al}_2\text{Si}_2\text{O}_5\text{H}_4$. It is a layered silicate mineral, with one tetrahedral sheet of silica (SiO_4) linked through oxygen atoms to one octahedral sheet of alumina (AlO_6) octahedra. Rocks that are rich in kaolinite are known as kaolin or china clay.

Molybdenum in natural waters: A review of occurrence

Loading ratios, for all intents and purposes, are a "rule of thumb" approach for the design of stormwater infiltration systems. Loading ratios were not intended to be a rigid requirement. The loading ratio concept is a well-intended idea that has resulted in an unintended consequence and, as a result, DEP and county conservation districts ...
